
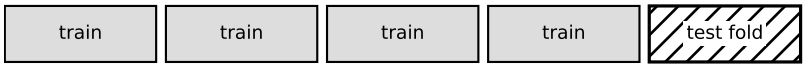
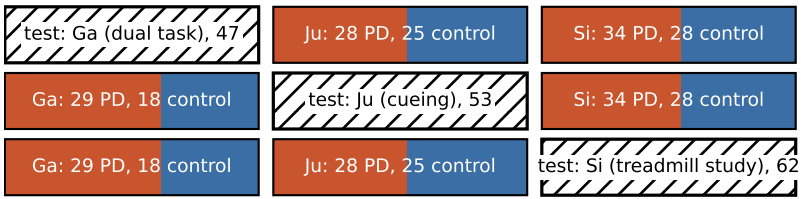
A. Within protocol: 5-fold cross-validation grouped by participant, repeated 20 times



Each fold holds about a fifth of the participants, stratified by group; a participant's recordings are never split between train and test. Reshuffled 20 times; the mean over the 100 test folds is reported with a 95% interval corrected for the overlap between training sets.

B. Across protocols: leave one sub-study out



Train on two sub-studies, test on the third. The protocols, recording lengths and ages differ between sub-studies, so this is the primary comparison; the interval is a bootstrap over the held-out participants.

C. Across cohorts: external test

A different research group and hardware; the same stride and swing timings from its pressure insoles or walkway. Run once, after the models are frozen. WearGait-PD counts are from its article, before participants under 50 are removed.
